

ABSTRACT

The invention relates to a contactor comprising an upper housing part (2), connecting bars (8) that are fixed in said part, a front housing cover and box terminals (20) that are located in terminal housings. The aim of the invention is to simplify the connection technique for the contactor. To achieve this, the housing cover consists of two right-angled cover halves (4, 6), whose respective front cover limbs (16) lie opposite one another in close proximity and which can be fixed onto the upper housing part (2). The cover limbs (18) of said housing cover on the connection side are configured as terminal housings.
